

NMCODE(c)

NMCODE(c)

NAME

nmcode — get name code for segment

SYNOPSIS

nmcode = 27.

ARGUMENTS(input)

capability associated with file
0 - byte offset in file

VALUES(returned)

0,1 - unique 32-bit name for segment

DESCRIPTION

The *nmcode* message is used to get a unique 32-bit name for a segment which is to be loaded from a file. The name is derived from the location of the file on secondary storage and is used to allocate memory space for a named segment.

SEE ALSO

intro(a).

DIAGNOSTICS

An error status byte is returned if the file corresponding to the capability does not correspond to an open file.
