HELP(I)   **HELP(I)**

NAME
      help — ask for help

SYNOPSIS
      help [arg]

DESCRIPTION
      Help finds information to explain a message from an SCCS command or the use of an SCCS
      command. The argument is either a message number or a command name. Message numbers
      normally appear in parentheses after the message. The program responds with explanatory in-
      formation.

      If the argument is omitted, the program will prompt for the argument.

      When all else fails, try "help stuck".

FILES
      The ASCII file /usr/lib/sccs.hf is used to store explanations. Anyone wishing to modify the file
      should list out a little of it — the format will be obvious.

DIAGNOSTICS
      Use *help* for them.
